

Full Asset Names

Documentation

Publisher: Yamraj Games

Version: 1.0.0 (Release)

Overview

Thank you for downloading **Full Asset Names**.

By default, Unity truncates long asset names in the **Project Window Grid View (Two Column Layout)**, making it difficult to distinguish between similarly named files.

For example:

- EnemyContr...
- PlayerMana...

This lightweight editor extension eliminates truncation by displaying the **complete asset name** directly beneath each asset icon using multiline text when necessary.

The package is contained entirely within an **Editor Assembly Definition**, ensuring:

- **Zero impact on runtime performance**
 - **No increase in build size**
 - **No effect on player build times**
 - **Automatic exclusion from all final game builds**
-

Installation

The package works immediately after import.

Installation Steps

1. Open the Package Manager (**Window > Package Manager**) or (**Window > Package Management > Package Manager**) and select **My Assets** from the top dropdown.
2. Locate “**Full Asset Names**”, click **Download**, and then click **Import**.
3. Once the import completes, the tool will automatically activate. Open your **Project Window** in **Grid View** to see the changes immediately.

No additional setup is required.

- snake_case

Examples

Frequently Asked Questions

Does this affect my game's performance or build size?

No.

The entire package is contained within an **Editor-only Assembly Definition (.asmdef)**.

The tool runs exclusively inside the Unity Editor and is automatically excluded from all builds, including:

- PC
 - Android
 - iOS
 - Console platforms
 - Web builds
-

Will this increase build times?

No.

Since the extension never becomes part of the player build pipeline, it has no impact on build duration.

Why does the formatting change in List View?

This tool is specifically designed for **Project Window Grid View**, where larger icons provide sufficient space for multiline labels.

When the Project Window is scaled down to Unity's **List View**, the extension automatically disables its custom rendering to avoid visual issues and seamlessly returns control to Unity's native display system.

This should not cause any bug or visual glitch if it does then do contact us.
